Design for a Milk-Bottle.

Specification forming part of Design No. 24,919, dated August 13, 1901.

Application filed May 15, 1901. Serial No. 60,408. Term of patent 7 years.

To all whom it may concern:

Be it known that I, Charles T. Nightingale, a citizen of the United States, residing at Chicago, in the county of Cook and State of Illinois, have invented and produced a new and original Design for a Milk-Bottle, of which the following is a specification.

The present invention relates to a novel design for a milk-bottle; and the object thereof is to provide a new, original, and useful design of this character.

The leading feature of the present design resides in a bottle which is circular in cross-section and comprises a bulged body portion that curves gradually and uniformly inward toward and into a circular bottom, the edge of the lower face of which merges into the adjacent portion of the body, the connecting portions of the side walls and bottom being continually and uniformly curved. The body portion also curves gradually and uniformly inward toward the upper end to form a curved breast, from which projects a centrally-disposed neck that tapers to its upper end. By this arrangement a milk-bottle is formed the exterior faces and interior faces of which present no sharp angles or edges.

In the drawings, Figure 1 is a side elevation of a milk-bottle embodying the present design. Figure 2 is a longitudinal sectional view of the same. Figure 3 is a horizontal cross-section taken on the line 3-3 of Figure 2. Figure 4 is a horizontal cross-section taken on the line 4-4 of Figure 2.

Referring now to the drawings, it will be seen that the milk-bottle is circular in cross-section and comprises a bulged body portion 5, that curves gradually and uniformly, as shown at 6, toward and into a circular bottom 7, the edge of the lower face of said bottom merging into the adjacent portion 6 of the body. This body portion also curves gradually and uniformly inward at its upper end to form a curved breast 8, from the central portion of which projects a centrally-disposed neck 9, that tapers from the breast 8 to its upper end.

Having now described my invention, what I claim as new, and desire to secure by Letters Patent, is—

The design for a milk-bottle as herein shown and described.

In testimony that I claim the foregoing as my own I have hereunto affixed my signature in the presence of two witnesses.

Charles T. Nightingale.
