UNITED STATES PATENT OFFICE.

THOMAS J. HURLEY, OF NEW YORK, N. Y.

DESIGN FOR A BOTTLE.

SPECIFICATION forming part of Design No. 16,864, dated August 24, 1886.

Application filed June 25, 1886. Serial No. 206,277. Term of patent 14 years.

To all whom it may concern:

Be it known that I, THOMAS J. HURLEY, of New York, in the county of New York and State of New York, have invented a new and original Design for Bottles; and I do hereby declare the following to be a full, clear, and exact description of the invention, such as will enable others skilled in the art to which it pertains to make and use the same.

My invention relates to a design for bottles; and it consists in a bottle having an elongated body, a short neck, and an annular collar, as hereinafter fully described.

In the accompanying drawings, Figure 1 illustrates a side view of the bottle, showing opposite ribs formed by the molds in the process of manufacture; and Fig. 2 is a similar view of the upper portion of the bottle turned a quarter revolution from the position shown in Fig. 1.

The body portion A is cylindrical in form, and is bent inward at its upper end, forming abrupt curves a , which join the vertical base b of the neck.

C represents an annular collar or head, connecting the vertical base b of the neck, with the upper portion, B, thereof, which latter is formed with a cap, D.

G represents the diametrically-opposite ribs formed by the mold in making the bottle.

It will be observed that the base b of the neck joins the curves a of the body A in such a manner as to form sharp angles a' .

I claim—

The design for bottles herein shown and described, consisting of the elongated cylindrical body A, the vertical neck base b , joining the curves of the body with sharp angles a' , the annular bead C, main neck portion B, and cap D, substantially as described.

In testimony whereof I have signed this specification in the presence of two subscribing witnesses.

THOMAS J. HURLEY.
